Experience

DevOps Engineer - CU Boulder

Jul 2019 - Present

Hired as a Unix Systems Engineer; my title changed to DevOps Engineer as my responsibilities grew.

- Development and maintenance of CI/CD and monitoring systems for around 150 Linux hosts using Ansible/AWX, Chef, Git, GitHub Actions, Jenkins, Nagios/Naemon, OpenShift, Red Hat Satellite, Terraform, and Vault.
- Write and maintain shared Ansible roles applied to every host we deploy, tested with Test Kitchen across RHEL versions.
- Moving and maintaining OIT services in Red Hat OpenShift using Ansible, Kustomize, and Vault, including our Sectigo certificate proxy, our kickstart web service, and a Flask broker I built for Dell OpenManage Enterprise.
- Help maintain our GitHub organization as code, cutting new repository setup from hours to minutes: Terraform and GitHub Actions create repositories from templates, along with their PR rules, AWX projects, and secrets from Vault.
- Maintain our Red Hat Satellite server, including its upgrade to 6.17 on RHEL 9, and enabled Red Hat Insights at kickstart.
- Leading Red Hat upgrades from 6 to 8, 7 to 9, and now 8 to 10 across about 25 hosts, from small faculty websites to the Dartmouth Flood Observatory’s ArcGIS application.
- Built our internal yum repository for custom RPMs and the Vagrant image repository our Jenkins pipelines test against.
- Moved our Jenkins pipelines and RHEL image builds from pyenv and rbenv to mise.
- Maintain our custom ServiceNow paging service for 15 teams, including its migration from sendmail to Postfix, its first automated tests, syncing through GitHub Actions, and restricting which domains it accepts mail for.
- Added certificate based authentication to our centralized log server.
- Major contributor to our team documentation, from configuration management guidelines to monitoring, certificate, and on-call guides.
- 24/7 on-call support for critical services across the university.

DevOps Consultant - Fenway Group

Feb 2016 - Jun 2019

- Member of the MX DevOps team contracted to Southwest Airlines for the largest single maintenance, repair, and overhaul system migration in airline industry history, moving three maintenance tracking systems onto IFS Maintenix.
- Built CI/CD, monitoring, and failover systems across hundreds of Debian and CentOS servers with Chef, Python, BASH, and Jenkins, with JUnit, Selenium, SoapUI, and JMeter testing pipelines and JasperReports on Tomcat in an HA environment.
- Wrote Vostok, a Python monitoring program served on Flask that showed the up/down status of every part of the Maintenix stack in all environments.
- Concurrently developed a Node.js application for Wellington Financial consolidating financial data across MySQL, Oracle, and Postgres databases.

Skills

Cloud & Containers: AWS, Azure, Docker, Helm, Kubernetes, Kustomize, OpenShift, VMware
Infrastructure as Code & CI/CD: Ansible/AWX, Chef, GitHub Actions, HashiCorp Vault, Jenkins, Terraform
Languages & Web: Bash, Flask, Java, JavaScript, JSON, Node.js, Python, React, REST, Ruby, YAML
Methodologies: Agile, Kanban, Scrum
Monitoring & Observability: Grafana, Loki, Nagios/Naemon, Prometheus, Red Hat Satellite
Operating Systems: Arch, CentOS, Debian, openSUSE, RHEL
Platforms & AI: Atlassian, ChatGPT, Claude, ServiceNow

Projects

- **find_a_flood** *(scripting)*: command-line tool that pulls NOAA river-gauge data to find potentially flooding rivers near a city.
- **infra_perez_wiki** *(cloud demo)*: multi-cloud CI/CD and monitoring in Terraform: AWS Jenkins, Azure Grafana/Prometheus/Loki, OIDC federation, one-button deploy/destroy.
- **perez_wiki** *(personal website)*: scripting and web development with Python, BASH, and basic continuous deployment.

Education

Louisiana Tech University, B.S. Computer Engineering · Aug 2014 - Feb 2019
